EFFECTS OF URBANIZATION ON THE MAGNITUDE AND FREQUENCY  
OF FLOODS ON SMALL STREAMS IN TENNESSEE - BASIC DATA REPORT NO. 2

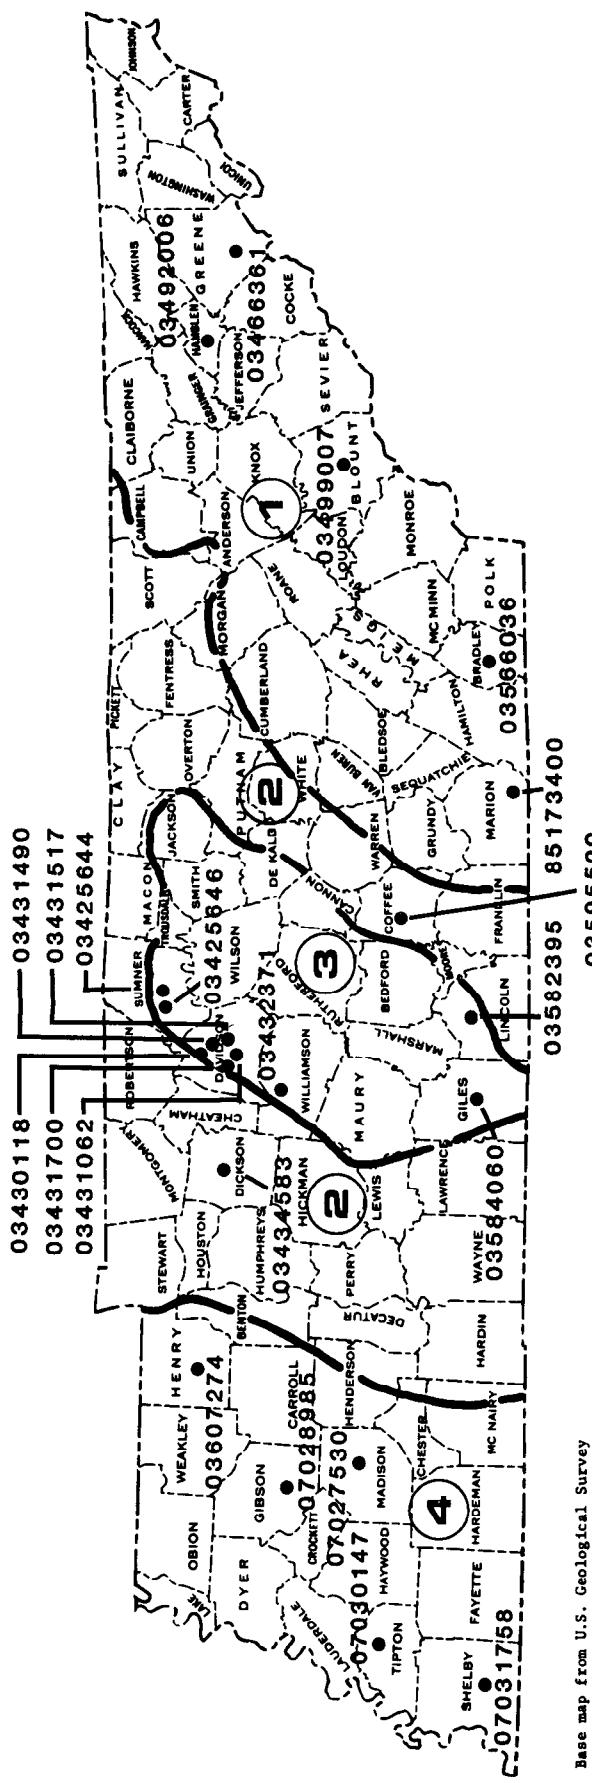

by Clarence H. Robbins

INTRODUCTION

Engineers involved in bridge, culvert and highway design often find it necessary to know the magnitude and frequency of discharge from small streams where the drainage basin is urbanized. In order to develop an adequate method for determining the frequency of floods on small streams in Tennessee, where urbanization is a factor, a considerable amount of runoff data are needed. At present there is a scarcity of runoff data from urban areas in Tennessee except in large metropolitan areas. With this in mind the U.S. Geological Survey and the Tennessee Department of Transportation entered into a cooperative agreement in July 1977 to collect data on streams draining less than about 25 mi<sup>2</sup> in municipalities with populations ranging between 5,000 and 100,000. The data collected under this project, in combination with urban runoff data collected in Memphis, Nashville and Knoxville, will give a full spectrum of runoff conditions likely to be experienced in Tennessee.

A total of 22 sites have been instrumented across the State as shown in figure 1. Each of the four hydrologic areas as defined in the report "Technique for Estimating Magnitude and Frequency of Floods in Tennessee," 1976, by Randolph and Gamble is represented.

This report summarizes data collected at these 22 sites during the period July 1977, to June 1982, and is the second basic data report to be released during the term of this project. The data presented in this report supersedes data in Basic Data Report No. 1.

### EXPLANATION

- 03431490      Site and number
- Hydrologic area boundary
- Hydrologic area number

2.5 0 2.5 5.0 10.0 Miles  
2.5 0 2.5 5.0 10.0 Kilometers

Figure 1.-- Location of gaging stations.

After sufficient data have been collected and analyzed, the Geological Survey Rainfall-Runoff model will be calibrated using these data. Urban runoff data from similar studies in Memphis, Nashville, and Knoxville will be incorporated into the data base of this study for the flood frequency analysis. Regional flood-frequency equations for the 2-year through the 100-year recurrence interval floods for small streams in urbanized areas will be developed using the expanded data base.

#### EXPLANATION OF DATA

The data, tabulated for each site, are composed of pertinent basin characteristics and major flood events above a predetermined discharge rate.

Basin characteristics: The basin drainage area (D.A.) is shown in square miles. The principle stream length (L), in miles, is from the drainage divide to the gage and was measured from 7 1/2-minute topographic maps. The main channel slope (S), in feet per mile, is the difference in elevation at points 10 percent and 85 percent of the main channel length measured upstream from the gage and divided by 75 percent of the stream length. Pervious, impervious, non-effective impervious, and noncontributing area (in percent of total area) are measured from aerial photographs of each site. These four characteristics have not been determined for some of the sites presented in this report.

Runoff events: Column headings are self-explanatory. Rainfall data are not available for some flood events because of equipment malfunctions. In addition, rainfall distribution over the basin for some events was such that no rainfall was recorded at the gage. The rainfall listed under the column heading "Total accumulated rainfall" is the total amount of rainfall associated with each runoff event. Only those events with complete rainfall and discharge data will be used in the model calibrations.

Data tabulated in this report are the best available at this time but should be considered provisional and subject to change, especially discharge values which are dependent on rating curve definition.

## CUMBERLAND RIVER BASIN

03425644 Town Creek above Gallatin, TN

Location.--Lat  $36^{\circ}24'17''$ , long  $86^{\circ}25'36''$ , Sumner County, 200 feet above culvert on U.S. Highway 31E, 1.3 miles northeast of intersection of highway 109 and 31E in Gallatin.

Gage and history.--Dual digital recorders with 5-minute punch intervals, housed in separate shelters. Station established May 8, 1981.

Basin characteristics.--D. A. =  $2.25 \text{ mi}^2$ ; L = 2.52 mi; S = 68.8 ft/mi; percent pervious = 97.66; percent impervious = 2.28; percent noneffective impervious = 0.06; percent noncontributing D. A. = 0.

Remarks.--All peaks are listed. Stage-discharge relation is not defined at this time.

## CUMBERLAND RIVER BASIN

03425646 Town Creek at Gallatin, TN

Location.--Lat  $36^{\circ}22'50''$ , long  $86^{\circ}27'15''$ , Sumner County, at bridge on Maple Street, 1.6 miles upstream from mouth.

Gage and history.--Dual digital recorders with 5-minute punch intervals, housed in separate shelters. Station established October 28, 1977.

Basin characteristics.--D. A. =  $4.90 \text{ mi}^2$ ; L = 5.07 mi; S = 37.6 ft/mi; percent pervious = 90.36; percent impervious = 5.55; percent noneffective impervious = 3.79; percent noncontributing D. A. = 0.30.

Remarks.--Peaks above 5.0 feet are listed.

## CUMBERLAND RIVER BASIN

034 31517 Cummings Branch at Lickton, TN

Location.--Lat  $36^{\circ}18'25''$ , long  $86^{\circ}48'00''$ , Davidson County, on right downstream wingwall of bridge, on Shaw Road, 900 feet above confluence with Shaw Branch, 0.8 miles northeast of Lickton.

Gage and history.--Dual digital recorders with 5-minute punch intervals, housed in separate shelters. Station established December 1, 1975.

Basin characteristics.--D. A. =  $2.40 \text{ mi}^2$ ; L = 2.71 mi; S = 71.4 ft/mi; percent pervious = 98.16; percent impervious = 1.84; percent noneffective impervious = 0; percent noncontributing D. A. = 0.

Remarks.--Peaks above 2.6 feet are listed.

## TENNESSEE RIVER BASIN

03499007 Pistol Creek at Alcoa, TN

Location.--Lat  $35^{\circ}46'08''$ , long  $83^{\circ}58'58''$ , Blount County, about 150 feet upstream from Calderwood Ave., 7.6 miles upstream from mouth.

Gage and history.--Dual digital recorders with 5-minute punch intervals, housed in separate shelters. Station established January 4, 1978.

Basin characteristics.--D. A. =  $15.7 \text{ mi}^2$ ; L =  $8.27 \text{ mi}$ ; S =  $25.8 \text{ ft/mi}$ ; percent pervious = 88.40; percent impervious = 6.51; percent noneffective impervious = 5.09; percent noncontributing D. A. = 0.

Remarks.--Peaks above 4.0 feet listed.

\*Prior to July 19, 1979, gage located 10 feet upstream from present site.

## OBION RIVER BASIN

07027530 South Fork Forked Deer River tributary at Jackson, TN

Location.--Lat  $35^{\circ}37'01''$ , long  $88^{\circ}49'19''$ , Madison County, upstream from culvert at Farrar Street at Jackson and 20 feet east of intersection of Union Street.

Gage and history.--Dual digital recorders with 5-minute punch interval, housed in separate shelters. Station established December 2, 1977.

Basin characteristics.--D. A. =  $0.98 \text{ mi}^2$ ; L = 1.64 mi; S = 54.9 ft/mi.

Remarks.--Peaks above 6.5 feet listed.
